Abstract

Purpose – The benefits of humor for general well-being have long been touted. Past empirical research has suggested that some of these benefits also exist in the work domain. However, there is little shared understanding as to the role of humor in the workplace. The purpose of this paper is to address two main gaps in the humor literature. First, the authors summarize several challenges researchers face in defining and operationalizing humor, and offer an integrative conceptualization which may be used to consolidate and interpret seemingly disparate research streams. Second, meta-analysis is used to explore the possibility that positive humor is associated with: employee health (e.g. burnout, health) and work-related outcomes (e.g. performance, job satisfaction, withdrawal); with perceived supervisor/leader effectiveness (e.g. perceived leader performance, follower approval); and may mitigate the deleterious effects of workplace stress on employee burnout.

Design/methodology/approach - The authors examine the results of prior research using meta-analysis (k = 49, n = 8,532) in order to explore humor's potential role in organizational and employee effectiveness.

Findings – Results suggest employee humor is associated with enhanced work performance, satisfaction, workgroup cohesion, health, and coping effectiveness, as well as decreased burnout, stress, and work withdrawal. Supervisor use of humor is associated with enhanced subordinate work performance, satisfaction, perception of supervisor performance, satisfaction with supervisor, and workgroup cohesion, as well as reduced work withdrawal.

Research limitations/implications – Profitable avenues for future research include: clarifying the humor construct and determining how current humor scales tap this construct; exploring the role of negative forms of humor, as they likely have different workplace effects; the role of humor by coworkers; a number of potential moderators of the humor relationships, including type of humor, job level and industry type; and personality correlates of humor use and appreciation.

Practical implications – The authors recommend caution be exercised when attempting to cultivate humor in the workplace, as this may raise legal concerns (e.g. derogatory or sexist humor), but efforts aimed at encouraging self-directed/coping humor may have the potential to innocuously buffer negative effects of workplace stress.

Originality/value - Although psychologists have long recognized the value of humor for general well-being, organizational scholars have devoted comparatively little research to exploring benefits of workplace humor. Results underscore benefits of humor for work outcomes, encourage future research, and offer managerial insights on the value of creating a workplace context supportive of positive forms of humor.

Keywords Humour, Job satisfaction, Morale, Employees behaviour, Supervisor effectiveness, Subordinate performance, Workgroup cohesion, Burnout

Paper type Research paper

The authors would like to thank Sasha Horowitz for her assistance collecting articles for this meta-analysis.

Journal of Managerial Psychology Vol. 27 No. 2, 2012 pp. 155-190 © Emerald Group Publishing Limited 0268.3946 DOI 10.1108/02683941211199554 Any man who has had the job I've had and didn't have a sense of humor wouldn't still be here (Harry S. Truman).

Having a sense of humor has long been thought to decrease depression, anxiety and stress, as well as enhance one's mood, immunity to illness, and life/family satisfaction (e.g. Celso et al., 2003; Martin, 1996; Lefcourt, 2001; Martin, 2001; Martin and Dobbins, 1988; McGhee, 1999). In the 1980s researchers began to explore the possibility that sense of humor may also contribute to workplace effectiveness (e.g. Bizi et al., 1988; Burford, 1985, 1987; Decker, 1987; Duncan, 1982, 1984, 1985; Malone, 1980; Nezu et al., 1988; Parsons, 1988; Remington, 1985). Indeed, empirical research has reported positive associations between sense of humor and creativity, socialization, employee bonding, rapport and morale (Clouse and Spurgeon, 1995; Duncan et al., 1990; Holmes and Marra, 2002; O'Quin and Derks, 1997; Romero and Cruthirds, 2006). Positive workplace humor has been found to alleviate boredom and frustration (e.g. Duncan, 1982; Malone, 1980; Pryor et al., 2010; Roy, 1960; Sykes, 1966), promote effective communication (e.g. Lippitt, 1982; Sherman, 1988), and reduce social distances between people yielding improved peer relations (e.g. Kane et al., 1977; Masten, 1986; Sherman, 1988). Research also suggests positive humor may have the potential to buffer the deleterious effects of workplace stress through its use as a coping mechanism (helping promote relaxation, tension reduction, and dealing with disappointments; Lippitt, 1982), and its ability to lubricate social interactions in stressful circumstances (Martin et al., 2003).

In the present study, we address two main gaps in the humor literature. First, we summarize several challenges researchers face in defining and operationalizing humor, and offer an integrative conceptualization which may be used to consolidate and interpret seemingly disparate research streams. Second, we use meta-analysis to explore the possibility that positive humor:

- is associated with employee health (e.g. burnout, health) and work-related outcomes (e.g. performance, job satisfaction, withdrawal);
- is associated with perceived supervisor/leader effectiveness (e.g. perceived leader performance, follower approval); and
- may mitigate the deleterious effects of workplace stress on employee burnout.

Figure 1 provides an overview of the relationships examined in this meta-analysis.

Humor: a theoretical overview

Researchers have spent centuries trying to isolate a definition for "humor" and to describe what it means to say someone has a "sense of humor". However, these efforts have been fraught with complications given the complexity of the humor construct (Allport, 1961; Foot, 1991; Freud, 1928; Kuiper and Martin, 1998; Martin, 2001; Martin *et al.*, 2003; Maslow, 1954; Robert and Yan, 2007; Vaillant, 1977; Warnars-Kleverlaan *et al.*, 1996). A review of the extant theoretical literature on humor suggests there are at least four contributing factors that make defining and operationalizing humor difficult:

- (1) the terms "humor" and "sense of humor" are often used interchangeably;
- (2) humor is multi-dimensional and the dimensions are seemingly diverse;
- (3) humor is quantified in various ways; and
- (4) there are numerous humor styles, some positive and some negative.

JMP 27,2

Positive humor in the workplace

157

Notes. As the vast majority of research on humor in the workplace has focused on positive/successful humor, this meta-analysis summarizes research on humor that is intended to produce positive outcomes at work. Although other types of humor have important implications in organizations (e.g., negative humor meant to belittle or intimidate others, gallows humor used to alleviate anxiety in tragic situations), an insufficient number of studies have been conducted on the more negative/detrimental forms of humor to permit their inclusion in a meta-analysis at this time. As such, we remind the reader that conclusions drawn from the results of this study are applicable to only positive forms of humor. Future research is needed which explores the implications of the "dark side" of humor at work

Semantics

One difficulty in operationalizing the humor construct may be semantic; some authors seem to use "humor" and "sense of humor" interchangeably, when in fact they refer to different aspects of the humor construct. To complicate matters further, there exists an array of definitions of both humor and sense of humor in the literature. For instance, Martineau (1972, p. 114) views humor as "any communicative instance which is perceived as humorous". Crawford (1994, p. 57) defines humor as verbal and nonverbal communication which produces a "positive cognitive or affective response from listeners". More recent definitions include those of Romero and Cruthirds (2006, p. 59), "amusing communications that produce positive emotions and cognitions in the individual, group, or organization", and Robert and Yan (2007, p. 209), "an intentional form of social communication delivered by a 'producer' toward an 'audience'". Clearly, "humor is fundamentally a communicative activity" (Lynch, 2002, p. 423), but whether it is a stimulus, a cognitive process, an emotional or behavioral response, or all of these, remains somewhat of a debate among researchers (e.g. Martin, 2001). Importantly, researchers studying the benefits of humor in the workplace have tended to focus on a

Figure 1. Correlates of employee and leader positive humor examined in this meta-analysis concept called successful humor, defined as mutually amusing communications, wherein communications "intended by the speaker(s) to be amusing [are also] perceived to be amusing by" recipients (Holmes and Marra, 2002, p. 1693; cf. Crawford, 1994; Lynch, 2002; Martineau, 1972; Robert and Yan, 2007).

Proffered conceptualizations of "sense of humor" have ranged from describing sense of humor as a social skill (e.g. Foot, 1991; Goodman, 1983; Martineau, 1972; Warnars-Kleverlaan et al., 1996), an emotion-related personality trait (e.g. habitual cheerfulness; Ruch, 1996, 1998; Ruch and Kohler, 1998), a cognitive ability or process (e.g. ability to create, understand, or reproduce jokes; Feingold and Mazzella, 1993; Martin, 2001), an interpersonal communication behavior (e.g. Sherman, 1988), an aesthetic or behavioral response (e.g. appreciation or enjoyment of humorous material; Martin, 2001; Ruch and Hehl, 1998), a habitual behavior pattern (e.g. tendency to laugh or tell jokes to amuse others; Craik et al., 1996; Martin and Lefcourt, 1984), a perspective or attitude about life (e.g. positive attitude about humor; jovial or benused outlook on the world; Berg, 1990; Svebak, 1996), and a coping strategy or defense mechanism (e.g. tendency to maintain a humorous perspective despite adverse conditions; Lefcourt and Martin, 1986). The diversity of conceptualizations across studies suggest sense of humor has unique manifestations, but most humor researchers agree that 'sense of humor' is a personality trait that enables a person to recognize and use successful humor as a coping mechanism and/or for social/affiliative communications/interactions (Lynch, 2002; Martin, 1996; Martin et al., 2003; Thorson and Powell, 1993a).

Dimensions of humor

Another challenge in defining humor is capturing its many and diverse dimensions. Thorson and Powell (1993b) articulated four dimensions of humor in their *Multidimensional Sense of Humor Scale (MSHS)*: the ability to:

- (1) be humorous, have a sense of playfulness, and have a good time;
- (2) recognize humor, life's absurdities, and oneself as a humorous person;
- (3) appreciate humor as well as humorous people and situations; and
- (4) use humor as a coping and adaptive mechanism, being able to laugh at problems and/or deal with difficult situations.

Other authors have focused on some but not all of these components in their efforts to operationalize the humor construct. For example, Svebak (1974) assessed only three dimensions of humor in his *Sense of Humor Questionnaire (SHQ)*, which included:

- (1) sensitivity to humor, ability to notice humorous stimuli in one's environment;
- (2) attitudes toward humor, perceived value of humor in one's life; and
- (3) expression of humor, the ability to express and suppress humor emotions.

And, Martin and Lefcourt (1983) focused on only the coping dimension of humor in their *Coping Humor Scale (CHS)*. As is summarized in Table I, there has been a great deal of variability in how humor researchers have conceptualized the dimensionality of humor.

<u>160</u>	Free Sample scale items		(strongly agree to strongly disagree); one-item scale Indicate frequency with which individual tells jokes and/or is the focus of a joke	Each definition of humor is provided and respondent uses scale: $0 = never; 4 = very$ often	
	Conceptualization and dimensionality of humor	Authors argue coping humor is an adaptive/self- protective response strategy. Scale assesses the extent to which individuals use humor to cope with stress (Martin, 1996). In the development of the OCHS, the CHS items were revised to tailor it to specifically address the occupational aspect of humor coping (Minasian, 1990, Rosenberg, 1989) Does not provide a conceptual definition for sense of	"Humor is defined as a specific type of "Humor is defined as a specific type of communication that establishes an incongruent relationship or meaning and is presented in a way that causes laughter (Berger, 1976). A joke is any type of communication that has a witty or funny intent that is known in advance by the teller (Winick, 1976). Thus, even though there is a technical difference, we will use the terms "humor" and "chino"	interchangeably." (Duncan, 1984, p. 896) Scale assesses the extent to which a person perceives another to use each of six types of humor. (1) ethnic humor = humor used to express the alleged characteristics of racial, ethnic, regional, professional, or other subcultures, (2) gallows humor = humor to depict the object of tragedy such as war, disease, concentration camp, or oppressed country, (3) hostile humor = humor used to serve as a complaint such as expressions of anger, hostility and frustration, (4) sexual humor = humor used to address issues of a sexual nature, (5) slapstick humor = humor used as a gross exaggeration of a simplistic plot such as that of slipping on a barana peel or hitting someone over the head, and (6) word play humor = humor such as verbal bantering, pleasantries, and jocular talk to provide a sense of familiarity which does not offend or provide a sense of familiarity which does not offend or provide a sense of familiarity which does not offend	מווע וא למאווץ ומנווומוכע (ביווא, נאשו)
Table I.	Scale	Coping Humor Scale (CHS; Martin and Lefcourt, 1983); Occupational Coping Humor Scale (OCHS; a slight modification of the Coping Humor Scale by Martin and Lefcourt, 1983) Decker (1987)	Duncan (1984)	Ellis Humor Instrument (Ellis, 1991)	

Frequency scale used	in database 2	-	21	(continued)	Positive humor in the workplace
	d fumny stories when in a ry for jokes or funny communicate in a variety would not say I am a agree to strongly	Instrument includes 18 items comprised of common jokes from the American culture as well as 14 uncommon items meant to tap "humor reasoning ability". Parts of the jokes'puns are omitted and are to be completed by the respondent; scale scored by number of correct item completions. Samples include "Take my wife (please)", "I would never belong to a country club that would (have me for a member), "Did you hear about the David and Goliath cocktail? Two sips and you are (stoned)"; 32-item scale	Affiliative humor: "I enjoy making people laugh", "I don't have to work very hard at making other people laugh - I seem to be a naturally humorous person"; Self-enhancing humor: "Even when I'm by myself, I am often amused by the absurdities of life, "If I am feeling upset or unhappy, I usually try to think of something fumny about the situation to make myself feel better"; Aggressive humor: "If someone makes a mistake, I will often tease them about it", "If I don't like someone, I often use humor or teasning to put them down"; Self-defeating humor: "Letting others laugh at me siprifs", "I will often get carried away in putting myself down if it makes my family or friends laugh". 32-item scale		161
	Sample scale items "Regularly tell jokes and group", "Have no memo stories", "Use humor to of situations", "Friends fumy person" (strongly dissorreh: 17-item scale	Instrument incl common jokes as 14 uncommed reasoning abilit omitted and arr respondent, sca (please)", 'T wo (please)', 'T wo that would (hear about the sips and you at	Affiliative humor: "I don't have to work people laugh - I seem person"; Self-enhanciu by myself, I am often, by myself, I am often, life", "If I am feeling try to think of someth try to think of sometone n tease them about it", often use humor: "If someone n tease them about it", nuse humor: "I self-defeating humor: is my way of keeping spirits," "I will often a laugh", 32-item scale laugh", 32-item scale		
	Conceptualization and dimensionality of humor Scale assesses how likely a person is to produce humorous messages such as funny stories and jokes	Author argues sense of humor is (1) the ability to absorb and retain humor from the environment, (2) an individual's knowledge of humor, and (3) ability to reason humorously (humor comprehension; Feingold, 1983)	Authors argue sense of humor is a stable multi- faceted personality trait which varies along two dimensions: (A) whether it enhances the self or enhances relationships with others, and (B) whether humor is positive/beneficial or negative/detrimental to self/relationships; four humor dimensions result: (1) affiliative humor $=$ use of humor to amuse others; facilitate relationships, and reduce interpersonal tensions (Lefcourt, 2001); (2) self- enhancing humor $=$ coping humor, perspective- taking humor $=$ scarcasm, teasing, ridicule, derision, or disparagement humor; humor to manipulate or threaten; (4) self-defeating humor $=$ excessive self- disparaging humor, attempts to amuse others at one's disparaging humor, attempts to amuse others at one's	OWH CAPCING	
	Scale Humor Orientation Scale (Booth-Butterford and Booth- Butterford, 1991)	Humor Perceptiveness Test (HPT; Feingold, 1983)	Humor Styles Questionnaire (HSQ: Martin <i>et al.</i> , 2003)		Table I.

Authors argue that <i>sense of humor</i> "is really a way of looking at the world; it is a style, a means of self- protection and getting along" (p. 13). Scale assesses six elements of a person's sense of humor (recognition of oneself as a humorous person, recognition of
so concernition or present sectors or neuron recognition of oneself as a humorous person, recognition of others' humor, appreciation of humor, frequency and tendency to laugh, perspective on life which may fall along four dimensions of sense of humor: (1) humor appreciation, and (4) attitudes toward humor. (2) coping/adaptive humor. (3) humor appreciation, and (4) attitudes toward humor. Author argues humor. (3) humor appreciation, and humor is inherent in incongruity regardless of the perception of the audience Humor exists in the text or message of its based only upon the message of the feller without considering the audience's perception

Scale	Conceptualization and dimensionality of humor	F Sample scale items	Frequency scale used in database
Positive Supervisor Humor Scale (Decker and Rotondo, 2001)	Authors argue humor is "something underlying formal communication that has the potential to enhance leadership ability by shaping the work environment" (p. 451) Humor "is something that includes aspects of a trait or characteristic (i.e. being a humorous person) and of a socially determined exchange (i.e. something is not humorous until the audience perceives it to be so)" (p. 452)	Five-item scale; My supervisor "Has good sense of humor", "Communicates with humor", "Enjoys jokes", "Tells jokes", and "Uses non-offensive humor" (strongly agree to strongly disagree)	1
Sala (2000)	Author argues humor is indicated by the presence of laughter in social exchanges	Assessed frequency of laughter in social exchanges	1
Sense of Humor Index (Craik et al., 1996)	Authors argue there are five bipolar styles of humor (humor conduct): (1) socially warm versus cold, (2) reflective versus boorish, (3) competent versus inept, (4) earthy versus repressed, and (5) benign versus mean-spirited	Warm versus cold: "Displays a well-developed, habitual humorous style, even when not really feeling light hearted", "Displays fixed smile which seems to lack sincerity'; Reflective versus boorish: "Jokes about problems to make them seem ridiculous or even trivial". "Is competitively humorous, attempts to top others", Competent versus inept: "Is crushed when humorous efforts meet with less than enthusiastic reception", "Fails to see the point of jokes"; Earthy versus repressed: "Delights in parodies others find Blasphemous or obscene", "Is bored by slapstick comedy"; Benign versus mean-spirited: "Pokes fun at the naive or unsophisticated", "Occasionally makes humorous remarks betraying a streak of cruelty". 36-item scale	Ч
Sense of Humor Scale (Bowling <i>et al.</i> , 2004 with items written by Nathan A. Bowling)	Authors argue there are four facets to sense of humor: (1) coping humor, (2) generating humor, (3) humorous outlook on the world, and (4) attitudes toward humor. Devised a scale specifically to tap the "generating humor" facet of sense of humor	Generating Humor: scale includes five items: four by Bowling and one from the MSHS: "My friends often comment on how funny I am," I am the type of person who often plays practical jokes", "I find it easy to make other people laugh," "I am funnier than most other people", and "Other people tell me I say funny things" (I = strongly agree; $7 =$ strongly disagree)	1
		` 2	(continued)
Table I.		163	Positive humor in the workplace

164	Fr Sample scale items	Sensitivity to humor: "I can usually recognize a hint such as a twinkle in the eye or slight change in the voice as a mark of humorous intent" or "I usually find something comical, witty, or humorous in most situations" (total disagreement = 1; total agreement $= 4$); Attitudes toward humor: "Fun is always aimed at hurting something" or "It is my impression that those who try to be funny do it to hid their lack of self- confidence" (total agreement $= 1$; total disagreement $= 4$; Expression of humor: "Do you at times laugh so much that it actually hurts?" or "Do you sometimes find yourself laughing in situations where laughter is quite out of place?" (very seldom $= 1$; very often $= 4$).	Humor appreciation items relate to the frequency and intensity of laughter and amusement (e.g. laughing easily, tearing during laughter, Ruch, 1994); Humor creativity items relate to entertaining others (e.g. "my friends expect me to make them laugh")	
	Conceptualization and dimensionality of humor	Author argues sense of humor is an aspect of one's personality. Scale assesses generalized individual differences in humor recognition and appreciation along three dimensions: (1) sensitivity to humorous content and meta-messages (degree to which individuals recognize humor in situations). (2) attitude toward humorous people and situations (value of humor in one's life and extent to which individuals report enjoying or disliking humorous roles or comical situations), and (3) openness to the expression of mirth (extent to which individual expression of	Author argues sense of humor has two dimensions: (1) humor appreciation = "the ability to understand and enjoy messages containing humor creativity, as well as situations that are incongruous but not menacing", and (2) humor creativity = "the ability to perceive relationships between people, objects, or ideas in an incongruous way, as well as the ability to communicate this perception to others" (Ziv, 1984, p. 111)	
Table I.	Scale	Sense of Humor Questionnaire (SHQ; Svebak, 1974)	Sense of Humor Questionnaire (SHQZ; Ziv, 1981, 1984 as translated by Ruch, 1994)	

riequency scare used in database	10	Positive humor in the workplace
Sauppre scare menus	The SHRQ presents brief descriptions of 18 situations and requires the respondent to indicate the extent to which they would respond with mirth in each situation (using a five-point scale ranging from "I would have been particularly amused" from "I would have laughed heartily"). Sample items include "If you were awakened from a deep sleep in the middle of the night by the ringing of the telephone, and it was an old friend who was just passing through town and decided to call and say hello" and "You were traveling in a car in the writter and suddenly the car spun around on an ice patch and came to rest facing the wrong way on the opposite side of the highway. You were released also micudes items assessing importance of having friends who are easily amused, frequency the individual laugh/smiles, and degree to which their expression of mirth varies across situations.	165
Conceptualization and anticipation of manual of	Authors argue sense of humor is a fairly stable personality characteristic and focus on assessing the extent to which individuals find humor in their daily lives, regardless of the content. They define sense of humor as "the frequency with which a person smiles, laughs, and otherwise displays mirth in a wide variety of life situations" (Martin, 1996; p. 253). These is behaviors are assumed to reflect the harder to define perceptual, cognitive, and emotional processes which the experience of humor.	
	Situational Humor Response Questionnaire (SHRQ; Martin and Lefcourt, 1984)	Table I

Various quantifications of sense of humor

Further contributing to the difficulty of converging on a single meaning of humor is the variety of perspectives regarding how to quantify "sense of humor". According to Eysenck (1972), sense of humor may be quantified from three unique perspectives:

- (1) a conformist sense, emphasizing the degree of similarity between people's appreciation of humorous material;
- (2) a quantitative sense, referring to how often a person laughs/smiles and/or how often he/she is amused; and
- (3) a productive sense, focusing on the extent to which the person tells funny stories and/or amuses other people.

Indeed, a review of the scales summarized in Table I indicates that authors of common humor scales are not consistent in how they quantify sense of humor. For example, whereas Feingold's (1983) *Humor Perceptiveness Test* operationalizes sense of humor in the conformist sense, assessing the extent to which respondents know a number of "funny" jokes, Ellis' (1991) *Ellis Humor Instrument* operationalizes it in the quantitative sense, assessing the frequency with which the respondent laughs/smiles, and Bowling *et al.*'s (2004) *Sense of Humor Scale* operationalizes it in the productive sense, assessing how often a respondent tells jokes or attempts to amuse others. Such diversity across scales likely contributes to conceptual ambiguity and offers additional evidence of the multidimensionality of humor.

Humor styles

A fourth complication arises from the variety of styles individuals may adopt in their attempts at humor (e.g. collaborative/beneficial versus competitive/detrimental humor styles; Holmes and Marra (2002). Romero and Cruthirds (2006) elaborated five humor styles which vary by the extent to which they are collaborative versus competitive in nature/effect:

- affiliative humor non-threatening, non-hostile humor used to enhance social interactions;
- (2) self-enhancing humor humor centered internally that is used as a coping mechanism to buffer against stress;
- (3) aggressive humor humor used to victimize, ridicule or belittle others;
- (4) mild-aggressive humor teasing, like that used to communicate a reprimanding message with a humorous undertone; and
- (5) self-defeating humor humor used to lower one's own social status so as to be more approachable.

Considering how humor styles may differ across cultures (Kalliny *et al.*, 2006) the impact of style on the meaning of humor is potentially profound.

Integrating the humor construct

Martin *et al.* (2003) organized the extant literature on humor according to a two-dimensional framework; Figure 2 offers a visual adaptation of their theoretical model. According to this framework, various conceptualizations of humor (definitions, styles, uses) may be organized according to whether the humor is used to enhance the

IMP

27,2

Focus of Humor

Intra-psychic/Self

Coping/Self-Enhancing Humor

Affiliative Humor

Interpersonal/Social

Self-enhancing humor; use of humor as an Interpersonal humor; humor used to emotion-regulation or coping mechanism; enhance one's relationships with others, perspective-taking humor which permits a others' feelings of well-being and ease, cognitive reevaluation of stressful and/or to reduce conflicts and strengthen circumstances to reduce stress; humor cohesion (Martineau, 1972; Ziv, 1984). meant to protect the self (Lefcourt & Individuals who use affiliative humor tend Martin, 1986; Ziv, 1984). Individuals who to "say funny things, tell jokes, and engage use coping humor often are able to be in spontaneous witty banter to amuse others, amused by the incongruities of life and facilitate relationships, and reduce maintain a humorous perspective even when interpersonal tensions" (Martin et al., 2003, faced with stress/adversity (Kuiper, Martin p. 53); humor is non-hostile and affirming & Olinger, 1993) of self and others

Self-Defeating Humor

Humor which is excessively selfdisparaging; Although individuals using self-defeating humor are seen as witty/amusing, emotional neediness, avoidance or low self-esteem seems to underlie their use of humor (Fabrizi & Pollio, 1987; Martin *et al.*, 2003). Involves "attempts to amuse others by doing/saying funny things at one's own expense...to gain approval, allowing oneself to be the "but" of others' humor, or laughing along...when being ridiculed" (Martin *et al.*, 2003, p. 54).

Aggressive Humor

Humor used to tease, ridicule, disparage, or "put-down" others (Zillman, 1983); humor used to manipulate via an implied threat of ridicule (Janes & Olson, 2000). Tendency to express humor without regard for others feelings; impulse to use humor even when likely to hurt/alienate others (Martin et al., 2003).

Notes: This table is based on the 2x2 conceptualization of the everyday functions of humor proffered by Martin *et al.* (2003). This meta-analysis focuses on only humor which has the intent to be and/or is perceived to be positive or beneficial in nature

self (intra-psychic) or used to enhance one's relationships with others (interpersonal/social); and whether the humor is relatively benign, benevolent, and/or positive or whether the humor is potentially detrimental, injurious, and/or negative. This two-dimensional conceptualization yields four humor types/categories (two which are positive, coping/self-enhancing and affiliative, and two which are negative, self-defeating and aggressive), within which prior research results and scale types might be organized. The vast majority of research on humor in the workplace has explored positive/successful humor.

Our review of the extant literature yields three additional insights which may further consolidate the seemingly disparate views of humor. First, researchers tend to agree that sense of humor is a stable personality trait that creates a propensity to use and recognize successful humor (Ruch, 1994, 1996, 1998; Ruch and Kohler, 1998), regardless of style in which it is manifested. Second, although there are many dimensions of humor, they are not necessarily mutually exclusive (e.g. a humorous

Nature of Humor

Positive humor in the workplace

167

Figure 2. Theoretical domain of studies of humor in the workplace communication may have both coping and affiliative effects). And, similar to the multiple dimensions of other complex constructs (e.g. organizational justice, commitment), the dimensions of humor may operate simultaneously. Third, humor styles may alter how humor is used and perceived by people, but they do not change what humor is (i.e. mutually amusing communications; Crawford, 1994; Holmes and Marra, 2002; Lynch, 2002; Martineau, 1972; Robert and Yan, 2007). Taken together, these insights suggest that although the various humor scales in existence (as well as the theoretical conceptualizations on which they are based) may be assessing different aspects of a person's sense of humor and may be quantifying it in different ways, they are tapping into the same overarching construct.

The role of positive humor in the workplace

In this study, we cumulate the extant literature on positive forms of humor in the workplace to explore the extent to which positive (coping or affiliative) humor is associated with desirable employee, team, and leader outcomes as well as the extent to which such humor may buffer the effects of workplace stress on employee burnout. Figure 1 summarizes the relationships we examine in this study.

Employee positive humor

Much humor research is focused on humor's effects on four personal outcomes: burnout, stress, coping, and health. The effects of humor on such personal outcomes has been explained in terms of more effective biological responses as well as due to enhanced quality of social support networks (Martin, 2001). The effects of humor on effective biological functioning is enshrined in folklore in well-known statements like "laughter is the best medicine" and proverbs like "a merry heart doeth good like a medicine" (as quoted in Martin, 2001, p. 504). Empirical research suggests laughter can positively affect cardiovascular functioning (Fry, 1994), and the positive emotions generated by humor may have analgesic or immuno-enhancing effects (Bruehl et al., 1993). Research also suggests individuals with a sense of humor are more socially competent and interpersonally adaptive (e.g. Masten, 1986), characteristics which facilitate the construction and maintenance of a wide social support network. As people with a sense of humor are more enjoyable to be around, a sense of humor may help buffer the effects of stress by attracting needed social support (Factor, 1997; Nezu et al., 1988). Moreover, humor is a way to express feelings (Graham *et al.*, 1992) and provides a means to communicate stressful ideas in a way that can be less distressing (Martin and Lefcourt, 1983). Social support has been found to play a substantial direct as well as moderating and mediating role in mitigating the stressor-strain relationship (Viswesvaran et al., 1999).

Burnout is often characterized by cynicism and excessive strain (Gaines and Jermier, 1983; Golembiewski, 1984; Maslach, 1982). Continuously experiencing stress increases the probability that burnout, as well as a variety of other negative outcomes like work withdrawal and health problems, will result (Talbot and Lumden, 2000). Studies have shown humor may reduce burnout by helping employees deal with difficult situations, release tension, regain perspective on their jobs, and facilitate an optimistic reinterpretation of events (Abel, 2002; Bischoff, 1990; Mesmer, 2000; Rosenberg, 1998; Talbot and Lumden, 2000). Ziv (1981, p. 55) argued "Though reality cannot be altered, one's attitude or perception about it can be temporarily modified so that effective coping behaviors are facilitated". Further, Bentley (1991, p. 114)

explained "The use of humor does not deny the stressful situation, but gives it a balance or a stabilizing effect". In sum, "The medical profession has something to say about humor. Laughter causes lungs to pump out carbon dioxide, eyes to cleanse themselves with tears, muscles to relax tension, adrenaline to increase, and the cardiovascular system to be exercised" (Barth, 1990, p. 171).

In addition to its effects on employees' personal outcomes, humor has been shown to be positively associated with work-related outcomes. Bizi et al. (1988) found that humor improved the quality of functioning and performance under stress, Morreall (1991) and Derks et al. (1998) found humor fosters mental flexibility, attention, and memory, and Berg (1990) reported humor increases openness to constructive feedback and motivates people to stretch beyond their assumed limits. Numerous studies have confirmed a significant relationship between humor and team creativity (e.g. Humke and Schaefer, 1996: Thorson and Powell, 1993a: Holmes, 2007) and productivity (Collinson, 1988; Duncan and Feisal, 1989). Research suggests humor may promote team cohesion via increased group harmony, collegiality, and inter-member attractiveness (Holmes, 2006; Stogdill, 1972), as well as by operating as a social lubricant (Morreall, 1991) that helps build group consensus and allows the group to withdraw momentarily from present, more serious concerns (Coser, 1960). It also affects team cohesion by generating positive affect among group members (Byrne and Neuman, 1992), emphasizing shared values (Meyer, 1997; Robert and Yan, 2007), masking the unpleasant content of messages (Holmes, 2000), and limiting friction in interactions (Fine and DeSoucev, 2005), Humor can be used to communicate information or to make a point in a positive way (Ullian, 1976), reduce social distance between group members (Graham, 1995), facilitate higher levels of trust (Hampes, 1999), and assist in creating the group's identity (Weick and Westley, 1996). Positive emotions shared among coworkers contribute to positive affect spirals which have been found to promote improved coworker relationships, group member performance, organizational citizenship behaviors, and work satisfaction (Evans and Dion, 1991; Gully et al., 1995; Mullen and Copper, 1994), factors which are also known to relate to reduced work withdrawal and turnover (Podsakoff et al., 2007; Tett and Meyer, 1993). Humor has also been associated with job satisfaction (Brief and Weiss, 2002; Booth-Butterfield et al., 2007; Parsons, 1988; Robert and Yan, 2007; Rupert and Kent, 2007; Schickedanz, 1993; Susa, 2002; Wanzer et al., 2005), reduced absenteeism (Spruill, 1992), lower turnover intentions (Factor, 1997), and higher organizational commitment (Susa, 2002). Taken together, these studies suggest that to the extent employee enhances communication and promotes constructive social interactions, positive work-related outcomes are likely to result.

Leader positive humor

Leader sense of humor influences many of the same employee work-related outcomes as does employees' own humor. For example, humor by leaders/supervisors has been shown to reduce withdrawal behaviors (Wells, 2008) and increase subordinate job satisfaction and commitment (Burford, 1987; Decker, 1987). In fact, Burford (1987) discovered that subordinates' ratings of their supervisors' sense of humor were related to the subordinates' job satisfaction, even though supervisors' ratings of their own sense of humor were not. Leader sense of humor likely affects these outcomes through many of the same mechanisms by which employees' humor does. However, supervisor humor may also operate in distinct ways as it has the twin potential of securing power and

Positive humor in the workplace

reducing social distance between supervisors and subordinates (Romero and Cruthirds, 2006). For instance, whereas employee humor may enhance performance by promoting increased creativity (Thorson and Powell, 1993a.), leader humor might improve performance by facilitating learning, helping change behavior, and reducing perceived threat associated with organizational change (Barbour, 1998). The use of humor by leaders is associated with increases in individual and unit performance (Avolio *et al.*, 1999) and has important implications for subordinate satisfaction with supervisors (Decker and Rotondo, 1999, 2001; Bass, 1990; Cooper, 2002; Crawford, 1994; Goleman, 1994; Vinton, 1989). Dixon (1980) found leaders who appropriately used humor inspired their subordinates to find creative and innovative solutions to complex problems. Further, leaders who are seen as effectively using humor may be more persuasive than their less-humorous counterparts, as humor creates positive affect (Kuiper *et al.*, 1995), increases liking for the source (Morkes *et al.*, 1999), suggests a shared set of personal values (Meyer, 1997), and increases trust in the source (Hampes, 1999).

In this study, we meta-analytically integrate the extant literature on positive workplace humor using the integrative conceptualization presented in Figure 2 to explore the possibility that humor is associated with employee health/work-related outcomes and perceived supervisor effectiveness, as well as the extent to which humor may mitigate the deleterious effects of workplace stress on employee burnout.

Method

Database

A total of 49 independent studies reported in 48 manuscripts (total N = 8,532) examining humor in the workplace were included in this meta-analysis. We compiled the relevant extant literature for this meta-analysis using a multi-faceted approach involving a computerized search of the PsycInfo and ABI Inform databases using relevant keywords or phrases (e.g. humor AND work, job satisfaction, leadership, climate, job performance, organizational commitment, burnout, health, etc.), and a manual search of references cited in recently published reviews (e.g. Romero and Cruthirds, 2006) as well as in studies included in this database.

To be included in our database, a study must have reported a relationship between supervisor/employee humor and at least one relevant correlate. Seventeen studies reported relationships between supervisor sense of humor and at least one relevant correlate. Thirty-two studies reported relationships between employee sense of humor and at least one relevant correlate. When authors reported multiple estimates of the same relationship from the same sample, a mean correlation was computed to maintain independence (Hunter and Schmidt, 2004). The studies included in the meta-analytic database are listed in the references prefixed with an asterisk.

Coding procedure and intercoder agreement

Each study was coded for sample size, operationalization of humor, correlations between humor and relevant correlates, and reliability estimates for humor and correlate variables, if reported. Two of the study's contributors independently coded the studies that met inclusion criteria. Intercoder agreement was very high (100 percent), likely due to the objective nature of the data coded. All studies examined either supervisor humor or employee humor. As is common in the humor literature, there were a variety of operationalizations of humor. Table I summarizes the various humor scales used in the

170

IMP

meta-analytic database, and reports the conceptual and operational definitions of humor used in these scales. Two primary types of correlates of humor were examined: employee personal (e.g. burnout, health) and work-related variables (e.g. performance, satisfaction).

Analysis

The meta-analytic methods outlined by Hunter and Schmidt (2004) were used to analyze this data. Corrections were made for sampling error and measure reliability (for humor and its correlates), as primary study estimates will both vary randomly from the population value as a function of sampling error, as well as systematically underestimate the true effects to the extent to which the predictor/criterion are not perfectly reliable (Hunter and Schmidt, 2004). As reliability estimates were not consistently reported in primary studies, corrections were made for measure reliability using artifact distribution meta-analysis.

Using regression analyses, we sought to determine the extent to which humor may buffer the relationship between workplace stress and burnout. Following the theory-testing method developed by Viswesvaran and Ones (1995), we conducted regression analyses on meta-analytically derived correlations between the variables (i.e. meta-analytic regression; Colquitt *et al.*, 2001; Zimmerman, 2008). To obtain an estimate of the true correlation between stress and burnout, we used reliability-corrected mean observed correlations reported in Lee and Ashforth (1996). We used the harmonic means of the total sample sizes on which each meta-analytic correlation from the input matrix was estimated to compute the standard errors associated with the regression coefficients (cf. Viswesvaran and Ones, 1995).

Results

Table II reports the results of meta-analyses examining relationships between employee humor and its correlates. Employee humor was found to relate negatively to burnout ($\rho = -0.23$, k = 13) and stress ($\rho = -0.25$, k = 17), and positively to health ($\rho = 0.21$, k = 9) and coping effectiveness ($\rho = 0.29$, k = 4). Employee humor was also found to positively correlate with work performance ($\rho = 0.36$, k = 3) and workgroup cohesion ($\rho = 0.20$, k = 3), and negatively correlate with work withdrawal ($\rho = -0.16$, k = 9).

As can be seen in Table III, results also suggest supervisor humor positively relates to subordinate job satisfaction ($\rho = 0.39$, k = 5) and workgroup cohesion ($\rho = 0.42$, k = 3), and negatively relates to subordinate work withdrawal ($\rho = -0.31$, k = 3). Supervisor humor also positively relates to subordinate perceptions of supervisor performance ($\rho = 0.45$, k = 10), as well as subordinate work performance ($\rho = 0.21$, k = 5) and subordinate satisfaction with supervisor ($\rho = 0.16$, k = 6).

Table IV reports the results of the meta-analytic regression examining the potential sense of humor buffers the relationship between workplace stress and burnout. Results suggest an employee's use of positive forms of humor (coping and affiliative humor) may cushion the negative effects of perceived workplace stress on burnout. Positive humor added between one and nine percent over workplace stress to our understanding of burnout. These results are consistent with prior research which suggests sense of humor mitigates stressful situations by promoting relaxation and reducing tension, and by permitting a positive reinterpretation of stressful events so they may be met in a more optimistic manner (Bentley, 1991; Bischoff, 1990; Lippitt, 1982; Martin *et al.*, 2003; Ziv, 1981).

Discussion

Martin *et al.* (2003) proposed that individuals may intend to use humor either positively or negatively, and may direct it either inwardly or interpersonally. We meta-analytically cumulated research on positive workplace humor, and found that regardless of whether it is self- or interpersonally-directed, it is associated with effective workplace functioning.

Implications for practice and society

Three key takeaways from our results are that positive sense of humor is associated with:

- (1) good physical and mental health;
- (2) buffers the negative effects of workplace stress on mental health; and
- (3) promotes effective functioning at work.

To the extent employees make use of positive forms of humor, our results suggest organizations may benefit from enhanced job performance and satisfaction as well as reduced costs associated with burnout, withdrawal and poor employee health. The more effective coping strategies adopted among humorous employees appear to buffer the harmful effects of stress and set the stage for more effective performance. Indeed, positive employee humor was associated with employee coping effectiveness, enhanced health, and reductions in perceived stress and burnout. It is likely that having a positive sense of humor permits employees to reframe stressful work events so they may be viewed in a more optimistic manner, allowing them to reduce tension and deal more effectively with disappointments (Lippitt, 1982). We also found the use of positive humor is associated with enhanced team cohesion, likely because it lubricates what might otherwise be stressful or awkward interactions, and reduces social distance between team members (Kane et al., 1977; Masten, 1986; Sherman, 1988). Future research might explore the potential team member positive sense of humor contributes to other important teamwork processes, like affect management and effective information sharing (Marks et al., 2001; Mesmer-Magnus and DeChurch, 2009).

Another key takeaway from our research is that an employee's perception of their leader's positive sense of humor is also associated with workplace effectiveness; leader use of positive humor was associated with enhanced subordinate job performance and satisfaction, reductions in subordinate work withdrawal, improvements in workgroup cohesion, and subordinate perceptions of leader performance. Messmer (2006) suggests managers who use humor to diffuse difficult situations are seen as more approachable and understanding of the challenges faced by their employees. Recent surveys by Robert Half International suggest 97 percent of employees feel it is important for managers to have a sense of humor because it appears to create a favorable workgroup climate and enhance supervisor/subordinate relationships (Witham, 2007).

One conclusion derived from these findings might be that organizations should attempt to cultivate humor within the workplace, encouraging it within employees and their leaders (e.g. Hampes, 1999; Kuiper *et al.*, 1995; Morkes *et al.*, 1999). Indeed, organizations that have incorporated measures of humor within their selection systems have reported impressive results (e.g. Cooper, 2008; Romero and Pescosolido, 2008). For example, Southwest Airlines screens employees for a light-hearted attitude, citing significant benefits including greater employee camaraderie and performance as well

Positive humor in the workplace

as enhanced customer satisfaction (Cooper, 2005, 2008; O'Reilly and Pfeffer, 1995). Others have suggested designing humor-training seminars "to teach participants how to select appropriate humor styles... and how to match humor styles to particular organizational outcomes" (Romero and Cruthirds, 2006; p. 66). Research on the effects of having fun while at work has found that when employees perceive the workplace to be fun, there may be positive implications for employee morale, creativity, performance, and commitment (Fluegge, 2008; Ford *et al.*, 2003; Lamm and Meeks, 2009; McDowell, 2004; Pryor *et al.*, 2010).

However, attempting to cultivate humor within the workplace may not be as simple as it sounds. Rather, "successful" humor requires that both the sender and receiver of a communication find it to be humorous. There is ample anecdotal evidence that perceptions of what constitutes a humorous message are not universal; what one person finds humorous, another might find insulting or derogatory. For example, many cases of hostile work environment harassment have originated from "joking" exchanges that were not perceived as humorous by all parties involved (e.g. *Gallagher* v. *CH Robinson Worldwide*, 2009; Meritor Savings Bank, 1986; Oncale v. Sundowner Offshore Services, 1998). Future research is needed to explore the feasibility of selection tools and training programs, which might predict/promote the use of successful/positive humor in the workplace.

Although we must be cautious not to make a sweeping recommendation to cultivate humor at work, we might look for ways to enhance positive, self-directed humor. Specifically, Martin *et al.* (2003) describe humor, which is used to help one cope with stressful circumstances by reframing stressful events and encouraging optimism. Although we were not able to examine coping humor independently from affiliative humor in this meta-analysis, it seems likely that the positive effects of humor on mental and physical health are derived from coping more than from affiliative humor. As coping humor is directed inwardly, there is less chance another individual might be offended by incongruous perceptions of what constitutes humor. Although confirming this assumption is a matter for future research, efforts exploring how best to promote a tendency towards coping humor make practical sense.

Implications for theory and future research

From a theoretical perspective, it appears that in order to make meaningful strides in our understanding of the role of humor at work and in life, researchers will need to more cleanly articulate the humor construct. Our review of the extant literature identified four factors which may have impeded progress in humor theory to date: semantic issues associated with describing humor versus sense of humor, identifying and describing dimensions of humor, how best to quantify humor, and various humor styles. As is summarized in Table I, a large number of humor scales exist in the extant literature and these scales operationalize humor (in terms of dimensions, styles, and quantifications) very differently. The Martin *et al.* (2003) framework offers an integrative theoretical perspective on the humor construct which appears useful for framing research and for devising scales which will permit measurement within each of the four humor categories (e.g. scales assess positive/negative humor, but do not typically permit measurement focused specifically on self-directed or interpersonal humor).

Conceptually, it makes sense to expect different patterns of relationships for self-directed versus interpersonal humor as well as positive versus negative humor;

JMP 27,2

however, the majority of current humor scales do not allow researchers to easily tease apart these concepts, raising an important direction for future research. Another important direction for future humor research would be a comparative validity assessment of existing humor scales so we might come to some conclusion as to which scales should be used to answer various questions. Importantly, the credibility intervals around the rhos reported for relationships examined in this study were fairly narrow and typically did not include zero, suggesting that although there were a variety of scales used in the primary studies, they did not result in discrepant conclusions regarding the role of humor in the workplace. We would have liked to have conducted a moderator analysis which examines the relationships broken out by all humor scales. Unfortunately, we had sufficient data to examine only three humor scales (the SHRQ, CHS, and MSHS) as moderators of the relationship between humor and five correlates. We conducted a post hoc moderator analysis to explore whether the scale used to assess humor moderates these relationships and report the results in Table V. With the exception of health, the confidence intervals overlap both across scale type and compared with the overall relationships reported earlier, suggesting no differences in reported relationships on the basis of these scales. With regard to the relationship between humor and health, the results of our moderator analysis suggest this relationship is stronger when humor is measured using the MSHS rather than the CHS. This is interesting in that the CHS assesses an individuals' use of humor when experiencing stress or in stressful situations whereas the MSHS assesses a tendency toward using humor in daily life. Perhaps this finding lends support to the notion that an orientation towards and appreciation for humor in life results in widespread positive outcomes, including reducing stress and enhancing one's overall healthiness (McGhee, 1999). Indeed, medical research has shown that people with a better sense of humor have higher IgA (a common antibody) levels, which are known to reduce the frequency of illness (McGhee, 1999). So, although using humor as a coping mechanism is successful in reducing stress and associated effects, a broader use of humor may yield greater overall health effects. Untangling this relationship is a matter for future research.

Another important direction for future research is to explore focus of humor (intra-psychic versus interpersonal) as a moderator of the role of humor in the workplace. We would expect that coping humor would have a stronger relationship with employee personal outcomes, particularly burnout, whereas affiliative humor would have a stronger relationship with certain work-related correlates, like team performance and cohesion. We were unable to conduct a moderator analysis on the basis of humor focus/style because the scales used in the primary studies often blended the two and item-level correlations were not reported.

Other potentially fruitful directions for future research are to examine:

- the role of humor in teams and by coworkers;
- sex differences in humor use (cf. Duncan *et al.*, 1990), and the potential supervisor/subordinate sex moderates humor relationships;
- the effects of humor on responses to workplace incivility (Cortina and Magley, 2009) and interpersonal aggressive behaviors (Berry *et al.*, 2007); and
- the personality correlates of effective humor use (we would expect humor to be a substantial pathway for the effects of personality on organizational outcomes; Ones *et al.*, 2007).

Positive humor in the workplace

number of "lost" studies reporting null findings necessary to reduce ρ to .05. We report both the credibility intervals (CV) and confidence intervals (CI) 1990); in other words, the CI estimates the variability around ρ due to sampling error. A 90% CI that excludes zero indicates that if our estimation procedures were repeated many times, 95 percent of the estimates of ρ would be a larger than zero (5 percent would fall beyond the upper limit of the interval). Rhos are considered generalizeable when the credibility interval excludes zero around ρ because each provides unique information about the nature of ρ (Hunter and Schmidt, 2004; Whitener, 1990). Specifically, the CV provides an estimate of the variability of true effects, assuming a random effects model. Wide CVs or those that include zero suggest the presence of a moderator. An 80 percent CV that excludes zero indicates that more than 90 percent of the corrected correlations (estimates of the super-population/true effects) are different from zero (10 percent lie beyond the upper bound of the interval). The CI provides an estimate of the accuracy of our estimation of ρ (Whitener,

An important consideration related to the interpretation of our results has to do with the nature of causality within the observed relationships. By virtue of the fact we cumulated correlations, it is possible the direction of causality in certain relationships is opposite that implied. For example, it is possible that workgroup cohesion and/or job satisfaction affect employee use of humor rather than the other way around (e.g. satisfied employees or members of cohesive teams are more likely to report using humor). Importantly, most researchers agree sense of humor is a dispositional tendency (e.g. Factor, 1997) and as such it is more likely to be the cause rather than the effect. However, it is important to remember the nature of causality may be reversed or reciprocal (e.g. stress reduces coping humor which increases stress, and so on). We have made every effort to temper use of causal phrasing in our discussion and interpretation of results, and instead discuss the constructs to which sense of humor appears to be associated. The meta-regression we report in Table IV should in no way imply a causal relationship between humor, stress, and burnout. Rather, we demonstrate that an already established correlation between stress and burnout (e.g. Lee and Ashforth, 1996) is attenuated when sense of humor is taken into account: it is a matter for future research to ascertain the nature of causality.

Another consideration relevant to the interpretation of our results relates to the small number of primary studies available for some of the meta-analyses. Although a number of studies have examined humor in the workplace, they have tended to be fairly limited in scope, and thus yielded only a small number of relevant relationships for inclusion in this meta-analysis, meaning we could not examine some potentially relevant moderators (e.g. use, type or style of humor, job type, level of employee, content of humorous exchanges). We do not know of any specific guidelines pertaining to a minimum number of studies required to conduct a meta-analysis, however we recognize second order sampling error poses a threat to the validity of our findings (Hunter and Schmidt, 2004). Importantly, the credibility intervals for these relationships tended to be narrow, suggesting consistency in the effects reported to date. Regardless, results of these small-*k* meta-analyses should be interpreted with caution and used as a guide for potentially fruitful directions for future research.

Conclusion

"Humor is a universal trait. It has existed in every culture, ancient and modern. It transcends language, geography, and time" (MacHovec, 1988, p. 6). Despite the enduring nature of humor, it has seldom been taken seriously by organizational scientists (Brief, 1998). Although anecdotal and empirical evidence suggests humor has significant positive implications for organizational and employee effectiveness, prior research investigating humor in the workplace has tended to be narrow in scope and published in diverse literatures, making it difficult to achieve a comprehensive understanding of the findings and implications. We attempt to fill this void by meta-analytically cumulating across these studies and reporting results relevant to multiple workplace dimensions. Our results confirm and clarify the valuable role positive humor plays in the workplace.
